

## SPECIFICATION

## CANNABINOID RECEPTOR MODULATOR

## Technical Field

5       The present invention relates to a benzene ring-fused 5-membered heterocyclic compound, especially a benzofuran derivative as a cannabinoid receptor modulator, and a pharmaceutical composition containing the same.

## 10       Background Art

      Cannabinoid receptors belong to G-protein conjugated receptor having the seven transmembraneous domain. Among these, CB1 receptor is predominately distributed in the central nervous system, of which existence is known by  
15       Devane W A et al. (Molecular Pharmacology, 34, 605-613 (1988)). CB2 receptor, which has a predominant cell distribution in the immune system and in the peripheral  
-tissues, has been discovered by Munro S et al. (Nature, 365, 61-65 (1993)). CB1 receptor and CB2 receptor show 48% of  
20       homology. 97 - 99% amino acid sequence of CB1 receptor is maintained in rat, mouse and human.

      In the brain, CB1 receptor exists predominately in hippocampus, striatum, substantia nigra, basal forebrain area, olfactory bulb and cerebellum, and little in the  
25       brain stem, medulla and thalamus. CB1 receptor is

localized in the presynapse, and is considered to control  
inhibitively the release of neurotransmitters (Trends  
Pharmacological Sciences, 22, 565-572 (2001)). For CB1  
receptor, four kinds of agonist are well known, i.e.,  
5 classic cannabinoids of tetrahydrocannabinol (THC)  
derivatives which are dibenzopyran rings, non-classic  
cannabinoids which are bicyclic and tricyclic derivatives  
prepared by cleavage of the pyran rings of the THC  
structure, aminoalkyl indols, and arachidonic acid  
10 derivatives such as anandamide which is known as an  
endogenous agonist (Science, 258, 1946-1949 (1992)).

WIN55,212-2, a cannabinoid receptor agonist, has been  
reported to inhibit neural cell death based on cerebral  
ischemia (Journal of Neuroscience, 19, 2987-2995 (1999)).

15 The action is believed to be caused by inhibiting the  
release of glutamic acid through the activation of the CB1  
receptor in the presynapse of glutamic acid neuron.

Further, anandamide which is an endogenous ligand has been  
reported to show inhibitory action on neural cell death  
20 after brain injury (Nature, 413, 527-531 (2001)). Further,  
Baker et al. have reported that WIN55,212-2, JWH-133, THC  
and methanandamide, which are cannabinoid receptor agonists,  
improved tremor or spasticity in the animal model of  
multiple sclerosis (Nature, 404, 84 (2000)).

25 Cerebrovascular disorders are the 2<sup>nd</sup> or 3<sup>rd</sup> leading

cause of death in Japan, USA and Europe, and the 1<sup>st</sup> leading cause of serious aftereffect of diseases, incurring a big medical loss. At present, active treatment to resolve the etiology (tPA, etc.) is performed for some of the patients suffering from cerebro-embolism and cerebro-thrombus, but it can be applied only to several percentages of the patients due to limited time-window for treatment. In most cases, only maintenance therapy of inhibiting cerebral edema and suppressing recurrence or enlargement (thrombolytics) has been performed, but effective drugs for treating the etiology or protecting the brain have not been developed. So far, many drugs having various mechanisms (e.g., glutamate antagonist, calcium antagonist, antioxidant, etc.) have been tried, but most of them have failed in the clinical trials.

Clinical efficacy of the brain-hypothermia therapy as a brain protecting therapy, has been studied, with building up intensive care system for cerebral stroke. Brain-hypothermia therapy is a therapy that maintains the brain temperature (cerebral temperature) low as 32 to 33°C, which has prominent brain-protecting effects. Therefore, this therapy has been drawing attention. However, this therapy requires 24-hour intensive care by intensive treatment facility and many staffs, which makes it difficult to be accepted as a general therapy.

On the other hand, the following compounds have been reported as a compound which has an aminoacyl group on the benzene ring of a bicyclic heterocycle in which the benzene is fused with a 5-membered heterocycle.

- 5 1) A compound represented by the following Formula

[wherein,  $R^3$  is an acylamino group, etc.] (Pamphlet of WO02/085866) which has analgesic action.

- 2) A compound represented by the following Formula

10

[wherein, W is an acylamino group, etc.] which has proliferating and differentiating action on stem cells or precursor cells of neuron (JP-A-2002-348239).

- 3) A compound represented by the following Formula

15

[wherein, the group  $NR^1R^2$  is an aminoacyl group, etc.]

which has sodium channel regulating action (Pamphlet of WO98/08842).

#### Disclosure of Invention

5           Cerebrovascular disorders are broadly classified into cerebral infarction, cerebral hemorrhage and subarachnoid hemorrhage. For the treatment, a confirmation waiting time for a proper diagnosis by X-ray, CT or MRI image diagnosis is required, which limits time-window for treatment.

10          However, a cannabinoid receptor agonist can resolve the problem of time-window for treatment since it is not selective for a certain type of disease. Further, a cannabinoid receptor agonist is expected to be a useful agent of preventing, treating or diagnosing cerebrovascular  
15          disorders such as cerebral infarction, cerebral hemorrhage, subarachnoid hemorrhage, etc., or head injury, or various inflammatory diseases. In addition, it eliminates the need for heavy intensive care system by the intensive treatment facilities and staffs which are normally required in the  
20          hypothermia therapy, but is expected to exert equivalent brain protecting effects to the hypothermia therapy.

          Therefore, the object of the present invention is to provide a benzene ring-fused 5-membered heterocyclic compound, having excellent modulating action on cannabinoid  
25          receptor function.

solve above problems, and as results, have found unexpectedly that the compounds represented by Formula (I<sub>0</sub>), (I), (I') and (I'') which have an aminoacyl group on the benzene-fused 5-membered heterocyclic group, have

#### Detailed Description of the Invention

The compound represented by Formula (I<sub>0</sub>) or a salt thereof [hereinafter, it may be abbreviated as Compound (I<sub>0</sub>).] is preferably the compound represented by Formula

(I) [hereinafter, it may be abbreviated as Compound (I).] or a salt thereof. As mentioned above, the compounds represented by Formula (I') and (I'') or a salt thereof which are contained in Compound (I<sub>0</sub>) and Compound (I), are novel compounds [hereinafter, the compound represented by Formula (I') will be explained, but explanations for the compound represented by Formula (I') are also applied to the compound represented by Formula (I''). Further, the compound represented by Formula (I') or a salt thereof may be abbreviated as Compound (I').].

The acylamino group represented by R<sup>0</sup> in the above-mentioned formulas is, for example, an acylamino group represented by the following formula

wherein, Y is -CO-, -SO-, or -SO<sub>2</sub>-, R<sup>5</sup> is a hydrogen atom or an optionally substituted hydrocarbon group, R<sup>6</sup> is a hydrogen atom, an optionally substituted hydrocarbon group, an optionally substituted hydroxyl group or an optionally substituted amino group, or R<sup>5</sup> and R<sup>6</sup> may be taken with an adjacent carbon atom or a sulfur atom and a nitrogen atom to form an optionally substituted ring, etc.

As used herein, Y is preferably -CO-, R<sup>5</sup> is preferably a hydrogen atom, etc., and R<sup>6</sup> is preferably an optionally

substituted hydrocarbon group or an optionally substituted amino group, etc.

The hydrocarbon group of the "optionally substituted hydrocarbon group" represented by  $R^5$ ,  $R^6$  and  $R^{6'}$  is, for example, a chain or cyclic hydrocarbon group (e.g., alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkandienyl, aryl, etc.) or a combined group thereof (e.g.,  $C_{7-14}$  aralkyl such as benzyl;  $C_{2-6}$  alkyl- $C_{6-14}$  aryl such as ethylphenyl, propylphenyl, etc.;  $C_{2-6}$  alkenyl- $C_{6-14}$  aryl such as vinylphenyl, isopropenylphenyl, etc.), or the like. Among these, a  $C_{1-16}$  chain or cyclic hydrocarbon group, etc. are preferred. Among these, alkyl is preferred for  $R^6$ .

10 200°C, preferably about -20 to about 150°C.

The product can be used in the next reaction as a crude product, or can be isolated from the reaction mixture according to a conventional method, and easily purified by conventional means of separation (e.g., recrystallization,

25 Compound (I), etc. and Compounds (Ia), (Ib), (Ic) and (Id)

which are contained in Compound (I), and Compound (I'), can be isolated and purified by conventional means of separation (e.g., extraction, recrystallization, distillation, chromatography, etc.) to produce pure compounds at the point when the isomers are generated. Further, the corresponding pure isomers can be also obtained by progressing isomerization of a double bond with an acid catalyst, a transitional metal complex, a metal catalyst, a radical species catalyst, an illumination or a strong base catalyst, or by heating, etc., according to the method described in New Experimental Chemistry Lecture 14 (Japanese Society of Chemistry), pp. 251-253, Experimental Chemistry Lecture 19 (Japanese Society of Chemistry), 4<sup>th</sup> Ed., pp. 273-274 and analogous methods thereto.

In addition, stereoisomers of Compound (I), etc. are generated depending on kinds of substituents, and these isomers which are isolated or mixed, are contained in the present invention.

In any case, Compound (I), etc. can be synthesized by deprotection, acylation, alkylation, hydrogenation, oxidation, reduction, carbon chain extension reaction, substituent exchange reaction, or a combination of two or more, if further desired.

When the objective compound is obtained in free form,

it can be converted to a salt by a conventional method. When the objective compound is obtained in salt form, it can be converted to free form or another salt by a conventional method. Thus obtained Compound (I), etc. can  
5 be isolated and purified from the reaction solution by known means such as solvent conversion, concentration, solvent extraction, fractional distillation, crystallization, recrystallization, chromatography, etc.

When compound (I) exists as configurational isomers,  
10 diastereomers, conformers, etc., the respective isomers can be isolated by the above-mentioned means of isolation and purification. Further, when compound (I), etc. are racemic compounds, they can be separated into (d) and (l) forms by any conventional optical resolution means.

carbonyl (e.g., benzyloxycarbonyl, etc.), trityl, phthaloyl, etc, which are optionally substituted, respectively. The substituent is, for example, a halogen atom (e.g., fluorine, chlorine, bromine, iodine, etc.), C<sub>1-6</sub> alkyl-carbonyl (e.g., acetyl, propionyl, valeryl, etc.), nitro, etc. The number of the substituent is, for example, 1 to 3.

In addition, the protective group may be removed by per se known methods or analogous methods thereto, for example, a method of treating the protective group with an acid, a base, ultraviolet ray, hydrazine, phenylhydrazine, sodium N-methyldithiocarbamate, tetrabutylammonium fluoride, palladium acetate, etc., or reduction.

To a solution of this compound (3.35 g, 10.4 mmol) in acetonitrile (40 mL) was added N-bromosuccinimide (1.85 g, 10.4 mmol) with ice-cooling, and the mixture was stirred for 30 minutes. The reaction solution was warmed to room temperature, to which water was added, which was extracted with ethyl acetate. The combined organic layer was washed with a saturated brine, dried over anhydrous sodium sulfate, filtered, and then concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (ethyl acetate : hexane = 1 : 19) to obtain 2.76 g (yield 66%) of 5-bromo-7-(4-isopropylbenzyl)-

2,2,4,6-tetramethyl-1-benzofuran-3(2H)-one as crude product.

The compound (2.76 g, 6.89 mmol), palladium acetate (31 mg, 0.14 mmol) and BINAP (257 mg, 0.41 mmol) were mixed at room temperature, and the mixture was stirred under argon stream

5 for 15 minutes. To the reaction solution was added sodium tert-butoxide (926 mg, 9.63 mmol) at room temperature, and the mixture was heated under argon stream at 110°C for 16 hours. Water was added to the reaction solution, which was extracted with ethyl acetate. The combined organic layer

10 was washed with water and a saturated brine, dried over anhydrous sodium sulfate, filtered, and then concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (ethyl acetate : hexane = 1 : 9) to obtain 675 mg (yield 23%) of the title compound.

(0.76 mL, 2.89 mmol) in toluene (15 mL) were added tris(dibenzylideneacetone)dipalladium (22 mg, 0.024 mmol) and BINAP (45 mg, 0.072 mmol) at room temperature, and the mixture was stirred under argon atmosphere for 15 minutes.

To the reaction solution was added sodium tert-butoxide (324 mg, 3.37 mmol) at room temperature, and the mixture was heated under reflux under argon stream for 16 hours.

Water was added to the reaction solution, which was extracted with ethyl acetate, and the organic layer was washed with water and a saturated brine, was dried over

anhydrous sodium sulfate, and then the solvent was distilled off under reduced pressure to obtain the crude product of N-(diphenylmethylene)-3-(4-isopropylphenyl)-4,6-dimethyl-2,3-dihydro-1-benzothien-5-amine. This compound

was dissolved in THF (10 mL), to which 1 N hydrochloric

acid (2 mL) was added, and the mixture then was heated under reflux for 30 minutes. The solvent was concentrated under reduced pressure to obtain the residue, which was neutralized with 1 N aqueous sodium hydroxide solution.

The product was extracted with ethyl acetate. The combined extract was washed with water, dried over magnesium sulfate,

and then concentrated under reduced pressure. The obtained residue was purified by silica gel column chromatography (ethyl acetate : hexane = 1 : 10) to obtain 521 mg (yield 73%) of the title compound. Melting point: 121 - 122°C (hexane - ethyl acetate).

[Experimental Example 1]

[<sup>3</sup>H]-CP55,940 binding assay with a cell membrane fraction expressing human CB1 and CB2 receptor

[<sup>3</sup>H]-CP55940 binding inhibition assay was conducted by incubating a CHO cell membrane fraction expressing human CB1 receptor and the test compound and 500pM [<sup>3</sup>H]-CP55940 in reaction buffer (50 mM Tris-HCl (pH7.4), 5 mM MgCl<sub>2</sub>, 2.5 mM EDTA and 0.5% BSA (fatty acid free)) at room temperature for 60 minutes. The reaction solution was filtered through GF/C filter, washed with 300 µl of washing buffer (50mM Tris-HCl (pH7.4), 0.05% BSA (fatty acid free)) four times, and the radioactivity of the filter was measured with a Top Count scintillation counter (Packard). As results, the test compound has inhibited binding of [<sup>3</sup>H]-CP55940 to the membrane fraction dose-dependently.

The inhibitory activity of the test compound to [<sup>3</sup>H]-CP55940 binding was calculated by percent on the basis that radioactivity is 100% when only 500pM [<sup>3</sup>H]-CP55940 was added, and 0% when 500pM [<sup>3</sup>H]-CP55940 and 100nM CP55940 were added at the same time. Further, IC<sub>50</sub> value of the test compound was calculated by analyzing concentrations and percents of the test compound with PRISM 3.0 (Graphpad Software, Inc.).

The same assay was also conducted for a CHO cell membrane fraction expressing human CB2 receptor, and the inhibitory activity to [<sup>3</sup>H]-CP55940 binding was calculated.

The results are shown in Table 8.

## [Experimental Example 2]

## Body temperature-lowering action on mouse

CBl receptor agonistic activity of the compound of the present invention in vivo was evaluated by investigating the effect on the body temperature of mouse after the drug was administered to the mouse. In this experiment, Jcl: ICR male mice (5 weeks old) were used. After measuring the rectal temperature with a thermometer (Physitemp BAT-12) that was connected to a probe for measuring body temperature, the compound dissolved in 2.2% EtOH and 5% G2- $\beta$ -cyclodextrin (solvent) was administered intraperitoneally. Solvent only was administered to the control group. 30 minutes after administration, rectal temperature was measured again. The experiment was conducted for 4 subjects per a group.

The test result was estimated as effective if the compound of the present invention lowered the body temperature substantially by 1°C or more when compared with the control group 30 minutes after administration of 1 mg/kg, i.p.

The results are shown in Table 9.

Effects of reducing cerebral infarction in experimental model of cerebral infarction

In this experiment, Jcl: SD male rats (8 weeks old) were used. A canula for infusion was inserted into the  
10 left common carotid vein under halothane anesthesia. Silicon-coated embolus was inserted into the left common carotid artery, to obstruct the middle cerebral artery (MCAO). 120 minutes after the obstruction, light anesthesia was conducted again with halothane, and  
15 reperfusion was done with the embolus removed. During MCAO, the rats were observed for neural symptoms. The rats expressing typical neural symptoms were used in the experiment. The drug was dissolved in 2.2% EtOH and 5% G2- $\beta$ -cyclodextrin (solvent). The test compound was  
20 administered intraperitoneally at three times as much as the minimum dose which was recognized to have body temperature lowering action immediately after the reperfusion, and further administered after 2, 4 and 6 hours at the same dose. As used herein, the test compound  
25 was selected from the compounds which had excellent

activities in Experimental Example 1 and Experimental Example 2. The same amount of the solvent was administered to the control group. 2 days after treating MCAO, the rats were decapitated, the brain was extracted and 6 frontal slices of 2 mm thickness was constructed under ice-cooling. Each slice was dyed with a 1% TTC solution at 37°C for 15 minutes, and photographed with a digital camera. White-part area of each slice was measured by image analyzing software (Photoshop (trademark)), and the volume of the infarction was calculated by multiplying the area by the thickness of the slice. As a result, 30% or more of infarction volume was recognized to be substantially reduced at the dose of 0.5 mg/kg.

As shown above, Compound (I), etc. have excellent modulating action on cannabinoid receptor function. Further, Compound (I), etc. have protective action on cerebral infarction, and, therefore, have medical actions such as treating cerebrovascular disorders. Further, Compound (I), etc. are considered to have very low toxicity and be well transferred into the brain.

#### [Industrial Applicability]

As described above, an excellent cannabinoid receptor modulator which is useful as a drug is provided according to the present invention.
